Chapter 1

The Lagrangian Step

1.1 Lagrangian governing equations

We consider Lagrangian fluid particles, for which we define their position $\mathbf{x}^+ = \mathbf{x}^+(t, \mathbf{y})$, density $\rho^+ = \rho^+(t, \mathbf{y})$, velocity $\mathbf{u}^+ = \mathbf{u}^+(t, \mathbf{y})$, and internal energy $e^+ = e^+(t, \mathbf{y})$. The vector \mathbf{y} is the location of each fluid particle at time zero and thus serves to differentiate between the different particles. The Eulerian counterparts for the density, velocity, and internal energy are, respectively, $\rho = \rho(t, \mathbf{x})$, $\mathbf{u} = \mathbf{u}(t, \mathbf{x})$, and $e = e(t, \mathbf{x})$. The vector \mathbf{x} is a location in Eulerian space. Also consider the volume Ω_0 as the set of all \mathbf{y} vectors that make up the initial domain. The control volume $\Omega^+ = \Omega^+(t, \Omega_0)$ is then defined by

$$\Omega^+ = \{\mathbf{x}^+ : \mathbf{y} \in \Omega_0\}. \quad (1.1)$$

Note that $\Omega^+(0, \Omega_0) = \Omega_0$.

The governing equations for the Lagrangian fluid particles are derived in my flow-physics notes. These are shown below

$$\frac{\partial \mathbf{x}^+}{\partial t} = \mathbf{u}^+, \quad (1.2)$$

$$\frac{\partial \eta_\alpha^+}{\partial t} = \alpha_\alpha^+, \quad (1.3)$$

$$\frac{\partial \eta_\alpha^+ \rho_\alpha^+}{\partial t} = -\eta_\alpha^+ \rho_\alpha^+ (\nabla \cdot \mathbf{u})_{\mathbf{x}=\mathbf{x}^+}, \quad (1.4)$$

$$\rho^+ \frac{\partial \mathbf{u}^+}{\partial t} = \left(\nabla \cdot \sum_\alpha \eta_\alpha \boldsymbol{\sigma}_\alpha \right)_{\mathbf{x}=\mathbf{x}^+}, \quad (1.5)$$

$$\eta_\alpha^+ \rho_\alpha^+ \frac{\partial e_\alpha^+}{\partial t} = (\eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \mathbf{u})_{\mathbf{x}=\mathbf{x}^+} - (\bar{p} \alpha_\alpha)_{\mathbf{x}=\mathbf{x}^+}. \quad (1.6)$$

In the above, η_α , α_α , and $\boldsymbol{\sigma}_\alpha = \boldsymbol{\sigma}(t, \mathbf{x})_\alpha$ are the volume fraction, closure model, and the stress tensor of material α . The term \bar{p} is the common pressure across all materials.

A note on notation. The products that involve a tensor $\boldsymbol{\tau}$ can be expressed in Einstein notation as

$$\nabla \cdot \boldsymbol{\tau} = \frac{\partial \tau_{ij}}{\partial x_j},$$

$$\begin{aligned}\boldsymbol{\tau} \cdot \nabla f &= \tau_{ij} \frac{\partial f}{\partial x_j}, \\ \mathbf{g} \cdot \boldsymbol{\tau} \cdot \nabla f &= g_i \tau_{ij} \frac{\partial f}{\partial x_j}, \\ \boldsymbol{\tau} : \nabla \mathbf{g} &= \tau_{ij} \frac{\partial g_i}{\partial x_j}.\end{aligned}$$

where f is a scalar and \mathbf{g} a vector. In these notes we'll mostly be using indices i and j for FE expansions, rather than for Einstein notation.

1.2 Lagrangian finite elements

We introduce a Lagrangian basis function $\Phi_i^+ = \Phi_i^+(t, \mathbf{y})$ and an Eulerian basis function $\Phi_i = \Phi_i(t, \mathbf{x})$. These are related to each other as any other Lagrangian-Eulerian pair, namely

$$\Phi_i^+(t, \mathbf{y}) = \Phi_i(t, \mathbf{x}^+(t, \mathbf{y})). \quad (1.7)$$

We now introduce the Lagrangian variable $f^+ = f^+(t, \mathbf{y})$ and the Eulerian counterpart $f = f(t, \mathbf{x})$, and they also satisfy

$$f^+(t, \mathbf{y}) = f(t, \mathbf{x}^+(t, \mathbf{y})). \quad (1.8)$$

The expansion of an Eulerian variable in terms of basis functions is as follows

$$f = \sum_i^n F_i \Phi_i, \quad (1.9)$$

where $F_i = F_i(t)$. Plugging in \mathbf{x}^+ for \mathbf{x} in the above, and using eqs. (1.7) and (1.8) gives

$$f^+ = \sum_i^n F_i \Phi_i^+. \quad (1.10)$$

Thus, both the Lagrangian and Eulerian variables share the same finite-element coefficients F_i .

As shown in my fluid mechanics notes, we also have

$$\frac{\partial \Phi_i^+}{\partial t} = \left(\frac{\partial \Phi_i}{\partial t} + \mathbf{u} \cdot \nabla \Phi_i \right)_{\mathbf{x}=\mathbf{x}^+}, \quad (1.11)$$

where $\mathbf{u} = \mathbf{u}(t, \mathbf{x})$ is the Eulerian counterpart to \mathbf{u}^+ . We'll introduce the restriction that Φ_i^+ is constant in time, that is $\partial \Phi_i^+ / \partial t = 0$, which gives

$$\frac{\partial \Phi_i}{\partial t} + \mathbf{u} \cdot \nabla \Phi_i = 0. \quad (1.12)$$

Thus, F_i in eq. (1.10) accounts for the time dependence of F^+ , whereas Φ_i^+ accounts for the dependence on \mathbf{y} .

1.3 Finite element expansion

We introduce the coefficients $\hat{\mathbf{x}}_i = \hat{\mathbf{x}}_i(t)$, $\hat{\mathbf{u}}_i = \hat{\mathbf{u}}_i(t)$ and $\hat{e}_i = \hat{e}_i(t)$, as well as the Lagrangian basis functions $\phi_i^+ = \phi_i^+(\mathbf{y}) \in L^2$, and $w_i^+ = w_i^+(\mathbf{y}) \in H^1$. We note that $\hat{\mathbf{x}}_i$ and $\hat{\mathbf{u}}_i$ are each vectors, e.g., the components of $\hat{\mathbf{u}}_i$ are $\hat{u}_{i,\alpha} = \hat{u}_{i,\alpha}(t)$ for $\alpha = x, y, z$. We also note that ϕ_i^+ and w_i^+ have Eulerian counterparts $\phi_i = \phi_i(t, \mathbf{x})$ and $w_i = w_i(t, \mathbf{x})$, respectively. The coefficients are used in the following expansions

$$\mathbf{x}^+ = \sum_j^{N_w} \hat{\mathbf{x}}_j w_j^+, \quad (1.13)$$

$$\mathbf{u}^+ = \sum_j^{N_w} \hat{\mathbf{u}}_j w_j^+, \quad (1.14)$$

$$e_\alpha^+ = \sum_j^{N_\phi} \hat{e}_{\alpha,j} \phi_j^+. \quad (1.15)$$

We note that the expansion coefficients are the same for the Lagrangian and Eulerian variables, as shown in section 1.2. For example, for the Eulerian velocity, we have

$$\mathbf{u} = \sum_j^{N_w} \hat{\mathbf{u}}_j w_j. \quad (1.16)$$

1.4 Semi-discrete Lagrangian governing equations

1.4.1 Position and Jacobian

Plugging in eqs. (1.13) and (1.14) in eq. (1.2) gives

$$\sum_j^{N_w} \frac{d\hat{\mathbf{x}}_j}{dt} w_j^+ = \sum_j^{N_w} \hat{\mathbf{u}}_j w_j^+.$$

To satisfy the equation above, we'll require

$$\frac{d\hat{\mathbf{x}}_j^+}{dt} = \hat{\mathbf{u}}_j.$$

We now introduce the vectors \mathbf{X} and \mathbf{U} , whose components are $\hat{\mathbf{x}}_i$ and $\hat{\mathbf{u}}_i$, respectively. Thus, the above is written as

$$\frac{d\mathbf{X}}{dt} = \mathbf{U}. \quad (1.17)$$

1.4.2 Density

We introduce the Jacobian matrix $\mathbf{J}^+ = \mathbf{J}^+(t, \mathbf{y})$, which is defined as

$$\mathbf{J}^+ = \frac{\partial \mathbf{x}^+}{\partial \mathbf{y}}. \quad (1.18)$$

It's determinant is denoted by $J^+ = J^+(t, \mathbf{y})$, and it satisfies the following equation

$$\frac{\partial J^+}{\partial t} = J^+ (\nabla \cdot \mathbf{u})_{\mathbf{x}=\mathbf{x}^+}. \quad (1.19)$$

Thus, Equation (1.4) can be re-written as

$$\frac{1}{\eta_\alpha^+ \rho_\alpha^+} \frac{\partial \eta_\alpha^+ \rho_\alpha^+}{\partial t} = -\frac{1}{J^+} \frac{\partial J^+}{\partial t},$$

or

$$\frac{\partial \eta_\alpha^+ \rho_\alpha^+ J_\alpha^+}{\partial t} = 0. \quad (1.20)$$

Since $J^+ = 1$ at the initial time, we obtain the density according to

$$\eta_\alpha^+ \rho_\alpha^+ = \frac{\eta_{\alpha,0}^+ \rho_{\alpha,0}^+}{J^+}, \quad (1.21)$$

where $\rho_0^+ = \rho^+(0, \mathbf{y})$. Note that summing over all α gives

$$\rho^+ = \frac{\rho_0^+}{J^+}. \quad (1.22)$$

To compute J^+ , we first plug in eq. (1.13) in the definition of the Jacobian matrix, which gives

$$\mathbf{J}^+ = \frac{\partial}{\partial \mathbf{y}} \sum_j^{N_w} \hat{\mathbf{x}}_j w_j^+ = \sum_j^{N_w} \hat{\mathbf{x}}_j \nabla_{\mathbf{y}} w_j^+.$$

We then simply compute the determinant of the above to obtain J^+ . Note that for any function \mathbf{x}^+ and its corresponding \mathbf{u}^+ , whether it be an exact analytical expression or a finite-element expansion as given by eq. (1.13), one obtains eq. (1.19). Thus, the derivation of eq. (1.20) from eq. (1.4) still holds whether one plans to represent J^+ using an analytical expression or a finite-element expansion.

1.4.3 Velocity

Plugging in eq. (1.22) in eq. (1.5) we get

$$\rho_0^+ \frac{\partial \mathbf{u}^+}{\partial t} = \left(\nabla \cdot \sum_\alpha \eta_\alpha \boldsymbol{\sigma}_\alpha \right)_{\mathbf{x}=\mathbf{x}^+} J^+.$$

We then multiply both sides of the above by the basis functions for velocity and integrate over all space to obtain

$$\int_{\Omega_0} \rho_0^+ \frac{\partial \mathbf{u}^+}{\partial t} w_i^+ dV_y = \int_{\Omega_0} \left(\nabla \cdot \sum_\alpha \eta_\alpha \boldsymbol{\sigma}_\alpha \right)_{\mathbf{x}=\mathbf{x}^+} w_i^+ J^+ dV_y.$$

For the left-hand side we have

$$\begin{aligned}
\int_{\Omega_0} \rho_0^+ \frac{\partial \mathbf{u}^+}{\partial t} w_i^+ dV_y &= \int_{\Omega_0} \rho_0^+ \sum_j^{N_w} \frac{d\hat{\mathbf{u}}_j}{dt} w_j^+ w_i^+ dV_y, \\
&= \sum_j^{N_w} \frac{d\hat{\mathbf{u}}_j}{dt} \int_{\Omega_0} \rho_0^+ w_i^+ w_j^+ dV_y, \\
&= \sum_j^{N_w} \frac{d\hat{\mathbf{u}}_j}{dt} m_{\mathcal{V},ij},
\end{aligned}$$

where

$$m_{\mathcal{V},ij} = \int_{\Omega_0} \rho_0^+ w_i^+ w_j^+ dV_y \quad (1.23)$$

is a mass bilinear form (which is independent of time). For the right-hand side we have

$$\begin{aligned}
\int_{\Omega_0} \left(\nabla \cdot \sum_{\alpha} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} \right)_{\mathbf{x}=\mathbf{x}^+} w_i^+ J^+ dV_y &= \int_{\Omega_0} \left[\nabla \cdot \left(\sum_{\alpha} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} \right) w_i \right]_{\mathbf{x}=\mathbf{x}^+} J^+ dV_y \\
&= \int_{\Omega^+} \nabla \cdot \left(\sum_{\alpha} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} \right) w_i dV_x \\
&= - \int_{\Omega^+} \sum_{\alpha} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} \cdot \nabla w_i dV_x.
\end{aligned}$$

The second equality above follows from integration by substitution. Combining results we have

$$\sum_j^{N_w} \frac{d\hat{\mathbf{u}}_j}{dt} m_{\mathcal{V},ij} = - \int_{\Omega^+} \sum_{\alpha} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} \cdot \nabla w_i dV_x. \quad (1.24)$$

We introduce the matrix $\mathbf{M}_{\mathcal{V}}$, whose components are $m_{\mathcal{V},ij}$. Thus, the left-hand side of eq. (1.24) can be written as $\mathbf{M}_{\mathcal{V}} d\mathbf{U}/dt$. We also introduce the vector bilinear form

$$\mathbf{f}_{ij,\alpha} = \int_{\Omega^+} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} \cdot \nabla w_i \phi_j dV_x. \quad (1.25)$$

This is a *vector* bilinear form since $\mathbf{f}_{ij,\alpha}$ has components $f_{ij,\alpha,\nu} = f_{ij,\alpha,\nu}(t)$, for $\nu = x, y, z$, where ν denotes the first index of $\boldsymbol{\sigma}_{\alpha}$. We introduce the force matrix \mathbf{F}_{α} , whose components are $\mathbf{f}_{ij,\alpha}$. We also expand the field with constant value of one as follows

$$1 = \sum_i^{N_{\phi}} \hat{1}_i \phi_i.$$

If we define the vector $\hat{\mathbf{1}}$ as that with components $\hat{1}_i$, we can show that

$$\begin{aligned}
\mathbf{F}_\alpha \hat{\mathbf{1}} &= \sum_j^{N_\phi} \mathbf{f}_{ij,\alpha} \hat{1}_j \\
&= \sum_j^{N_\phi} \int_{\Omega^+} \eta_\alpha \boldsymbol{\sigma}_\alpha \cdot \nabla w_i \phi_j dV_x \hat{1}_j \\
&= \int_{\Omega^+} \eta_\alpha \boldsymbol{\sigma}_\alpha \cdot \nabla w_i \left(\sum_j^{N_\phi} \hat{1}_j \phi_j \right) dV_x \\
&= \int_{\Omega^+} \eta_\alpha \boldsymbol{\sigma}_\alpha \cdot \nabla w_i dV_x.
\end{aligned}$$

Thus, eq. (1.24) can now be written as

$$\mathbf{M}_\nu \frac{d\mathbf{U}}{dt} = - \sum_\alpha \mathbf{F}_\alpha \hat{\mathbf{1}}. \quad (1.26)$$

We note that since both the Lagrangian and Eulerian velocities share the same coefficients \mathbf{U} , we now have a solution for both.

1.4.4 Energy

Plugging in eq. (1.21) in eq. (1.6) we get

$$\eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \frac{\partial e_\alpha^+}{\partial t} = (\eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \mathbf{u})_{\mathbf{x}=\mathbf{x}^+} J^+ - (\bar{p}\alpha_\alpha)_{\mathbf{x}=\mathbf{x}^+} J^+.$$

We then multiply both sides of the above by the basis functions for energy and integrate over all space to obtain

$$\int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \frac{\partial e_\alpha^+}{\partial t} \phi_i^+ dV_y = \int_{\Omega_0} (\eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \mathbf{u})_{\mathbf{x}=\mathbf{x}^+} \phi_i^+ J^+ dV_y - \int_{\Omega_0} (\bar{p}\alpha_\alpha)_{\mathbf{x}=\mathbf{x}^+} \phi_i^+ J^+ dV_y.$$

For the left-hand side we have

$$\begin{aligned}
\int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \frac{\partial e_\alpha^+}{\partial t} \phi_i^+ dV_y &= \int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \sum_j^{N_\phi} \frac{d\hat{e}_{\alpha,j}}{dt} \phi_j^+ \phi_i^+ dV_y, \\
&= \sum_j^{N_\phi} \frac{d\hat{e}_{\alpha,j}}{dt} \int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \phi_j^+ \phi_i^+ dV_y, \\
&= \sum_j^{N_\phi} \frac{d\hat{e}_{\alpha,j}}{dt} m_{\mathcal{E},ij,\alpha}
\end{aligned}$$

where

$$m_{\mathcal{E},ij,\alpha} = \int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \phi_j^+ \phi_i^+ dV_y \quad (1.27)$$

is a mass bilinear form (which is independent of time). For the first term on right-hand side we have

$$\begin{aligned} \int_{\Omega_0} (\eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \mathbf{u})_{\mathbf{x}=\mathbf{x}^+} \phi_i^+ J^+ dV_y &= \int_{\Omega_0} (\eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \mathbf{u} \phi_i)_{\mathbf{x}=\mathbf{x}^+} J^+ dV_y \\ &= \int_{\Omega^+} \eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \mathbf{u} \phi_i dV_x. \end{aligned}$$

For the second term on the right hand side we have

$$\begin{aligned} \int_{\Omega_0} (\bar{p} \alpha_\alpha)_{\mathbf{x}=\mathbf{x}^+} \phi_i^+ J^+ dV_y &= \int_{\Omega_0} (\bar{p} \alpha_\alpha \phi_i)_{\mathbf{x}=\mathbf{x}^+} J^+ dV_y \\ &= \int_{\Omega^+} \bar{p} \alpha_\alpha \phi_i dV_x. \end{aligned}$$

Combining results we have

$$\sum_j^{N_\phi} \frac{d\hat{e}_{\alpha,j}}{dt} m_{\mathcal{E},ij} = \int_{\Omega^+} \eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \mathbf{u} \phi_i dV_x - \int_{\Omega^+} \bar{p} \alpha_\alpha \phi_i dV_x.$$

We now show that

$$\eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \mathbf{u} = \eta_\alpha \boldsymbol{\sigma}_\alpha : \nabla \left(\sum_k^{N_w} \hat{\mathbf{u}}_k w_k \right) = \sum_k^{N_w} \hat{\mathbf{u}}_k \cdot \eta_\alpha \boldsymbol{\sigma}_\alpha \cdot \nabla w_k,$$

and hence the previous result is written as

$$\sum_j^{N_\phi} \frac{d\hat{e}_{\alpha,j}}{dt} m_{\mathcal{E},ij} = \sum_k^{N_w} \hat{\mathbf{u}}_k \cdot \int_{\Omega^+} \eta_\alpha \boldsymbol{\sigma}_\alpha \cdot \nabla w_k \phi_i dV_x - \int_{\Omega^+} \bar{p} \alpha_\alpha \phi_i dV_x.$$

The above is finally re-written as

$$\sum_j^{N_\phi} \frac{d\hat{e}_{\alpha,j}}{dt} m_{\mathcal{E},ij} = \sum_k^{N_w} \hat{\mathbf{u}}_k \cdot \mathbf{f}_{ki,\alpha} - c_{\alpha,i}, \quad (1.28)$$

where

$$c_{\alpha,i} = \int_{\Omega^+} \bar{p} \alpha_\alpha \phi_i dV_x \quad (1.29)$$

Note that in eq. (1.28) there is a dot product in first term of the right-hand side. To see this, we expand this term as follows

$$\sum_k^{N_w} \hat{\mathbf{u}}_k \cdot \mathbf{f}_{ki,\alpha} = \sum_k^{N_w} \sum_{a=x,y,z} \hat{u}_{k,a} f_{ki,\alpha,a}.$$

We now introduce the vector \mathbf{E}_α whose components are $\hat{e}_{\alpha,i}$, the matrix $\mathbf{M}_{\mathcal{E},\alpha}$ whose components are $m_{\mathcal{E},ij,\alpha}$, and the vector \mathbf{C}_α whose components are $c_{\alpha,i}$. Thus, eq. (1.28) can be succinctly written as

$$\mathbf{M}_{\mathcal{E},\alpha} \frac{d\mathbf{E}_\alpha}{dt} = \mathbf{F}_\alpha^T \cdot \mathbf{U} - \mathbf{C}_\alpha. \quad (1.30)$$

Note again that the first term on the right-hand side above has a matrix-vector product *and* a dot product. We also note that since both the Lagrangian and Eulerian internal energies share the same coefficients \mathbf{E}_α , we now have a solution for both.

1.5 Momentum and energy conservation

We first define the material internal energy $IE_\alpha = IE_\alpha(t)$, the kinetic energy $KE = KE(t)$, and the momentum $P_{\mathbf{n}} = P_{\mathbf{n}}(t)$ along a constant \mathbf{n} direction.

$$\begin{aligned}
IE_\alpha &= \int_{\Omega^+} \eta_\alpha \rho_\alpha e_\alpha dV_x \\
&= \int_{\Omega_0} \eta_\alpha^+ \rho_\alpha^+ e_\alpha^+ J^+ dV_y \\
&= \int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ e_\alpha^+ dV_y \\
&= \int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \sum_j^{N_\phi} \hat{e}_{\alpha,j} \phi_j^+ dV_y \\
&= \int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \sum_j^{N_\phi} \hat{e}_{\alpha,j} \phi_j^+ \left(\sum_i^{N_\phi} \hat{1}_i \phi_i^+ \right) dV_y \\
&= \sum_i^{N_\phi} \sum_j^{N_\phi} \hat{1}_i \int_{\Omega_0} \eta_{\alpha,0}^+ \rho_{\alpha,0}^+ \phi_i^+ \phi_j^+ dV_y \hat{e}_{\alpha,j} \\
&= \sum_i^{N_\phi} \sum_j^{N_\phi} \hat{1}_i m_{\mathcal{E},ij,\alpha} \hat{e}_{\alpha,j} \\
&= \hat{\mathbf{1}}^T \mathbf{M}_{\mathcal{E},\alpha} \mathbf{E}_\alpha
\end{aligned} \tag{1.31}$$

$$\begin{aligned}
KE &= \int_{\Omega^+} \frac{1}{2} \rho \mathbf{u} \cdot \mathbf{u} dV_x \\
&= \int_{\Omega_0} \frac{1}{2} \rho^+ \mathbf{u}^+ \cdot \mathbf{u}^+ J^+ dV_y \\
&= \int_{\Omega_0} \frac{1}{2} \rho_0^+ \mathbf{u}^+ \cdot \mathbf{u}^+ dV_y \\
&= \int_{\Omega_0} \frac{1}{2} \rho_0^+ \left(\sum_i^{N_w} \hat{\mathbf{u}}_i w_i^+ \right) \cdot \left(\sum_j^{N_w} \hat{\mathbf{u}}_j w_j^+ \right) dV_y \\
&= \sum_i^{N_w} \sum_j^{N_w} \frac{1}{2} \hat{\mathbf{u}}_i \cdot \int_{\Omega_0} \rho_0^+ w_i^+ w_j^+ dV_y \hat{\mathbf{u}}_j \\
&= \sum_i^{N_w} \sum_j^{N_w} \frac{1}{2} \hat{\mathbf{u}}_i \cdot m_{\mathcal{V},ij} \hat{\mathbf{u}}_j \\
&= \frac{1}{2} \mathbf{U}^T \cdot \mathbf{M}_{\mathcal{V}} \mathbf{U}.
\end{aligned} \tag{1.32}$$

$$\begin{aligned}
P_{\mathbf{n}} &= \int_{\Omega^+} \rho \mathbf{u} \cdot \mathbf{n} dV_x \\
&= \int_{\Omega_0} \rho^+ \mathbf{u}^+ \cdot \mathbf{n} J^+ dV_y \\
&= \int_{\Omega_0} \rho_0^+ \mathbf{u}^+ \cdot \mathbf{n} dV_y \\
&= \int_{\Omega_0} \rho_0^+ \left(\sum_j^{N_w} \hat{\mathbf{u}}_j w_j^+ \right) \cdot \left(\sum_i^{N_w} \hat{\mathbf{n}}_i w_i^+ \right) dV_y \\
&= \sum_i^{N_w} \sum_j^{N_w} \hat{\mathbf{n}}_i \cdot \int_{\Omega_0} \rho_0^+ w_i^+ w_j^+ dV_y \hat{\mathbf{u}}_j \\
&= \sum_i^{N_w} \sum_j^{N_w} \hat{\mathbf{n}}_i \cdot m_{\mathcal{V},ij} \hat{\mathbf{u}}_j \\
&= \mathbf{N}^T \cdot \mathbf{M}_{\mathcal{V}} \mathbf{U}.
\end{aligned} \tag{1.33}$$

The total energy is conserved, as shown below

$$\begin{aligned}
\frac{d}{dt} \left(\sum_{\alpha} I E_{\alpha} + K E \right) &= \sum_{\alpha} \hat{\mathbf{1}}^T \mathbf{M}_{\mathcal{E},\alpha} \frac{d\mathbf{E}_{\alpha}}{dt} + \mathbf{U}^T \cdot \mathbf{M}_{\mathcal{V}} \frac{d\mathbf{U}}{dt} \\
&= \sum_{\alpha} \hat{\mathbf{1}}^T (\mathbf{F}_{\alpha}^T \cdot \mathbf{U} - \mathbf{C}_{\alpha}) - \mathbf{U}^T \cdot \sum_{\alpha} \mathbf{F}_{\alpha} \hat{\mathbf{1}} \\
&= \hat{\mathbf{1}}^T \left(\sum_{\alpha} \mathbf{F}_{\alpha}^T \right) \cdot \mathbf{U} - \mathbf{U}^T \cdot \left(\sum_{\alpha} \mathbf{F}_{\alpha} \right) \hat{\mathbf{1}} \\
&= \hat{\mathbf{1}}^T \left(\sum_{\alpha} \mathbf{F}_{\alpha} \right)^T \cdot \mathbf{U} - \mathbf{U}^T \cdot \left(\sum_{\alpha} \mathbf{F}_{\alpha} \right) \hat{\mathbf{1}} \\
&= 0.
\end{aligned} \tag{1.34}$$

In the above, we used $\sum_{\alpha} C_{\alpha} = 0$ since $\sum_{\alpha} \alpha_{\alpha} = 0$. The momentum along a constant direction is

conserved, as shown below

$$\begin{aligned}
\frac{dP_{\mathbf{n}}}{dt} &= \mathbf{N}^T \cdot \mathbf{M}_V \frac{d\mathbf{U}}{dt} \\
&= -\mathbf{N}^T \cdot \sum_{\alpha} \mathbf{F}_{\alpha} \hat{\mathbf{1}} \\
&= -\sum_i^{N_w} \sum_j^{N_{\phi}} \sum_{\alpha} \hat{\mathbf{n}}_i \cdot \mathbf{f}_{ij,\alpha} \hat{\mathbf{1}}_j \\
&= -\sum_i^{N_w} \sum_j^{N_{\phi}} \sum_{\alpha} \hat{\mathbf{n}}_i \cdot \int_{\Omega^+} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} \cdot \nabla w_i \phi_j dV_x \hat{\mathbf{1}}_j \\
&= -\sum_i^{N_w} \sum_{\alpha} \hat{\mathbf{n}}_i \cdot \int_{\Omega^+} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} \cdot \nabla w_i dV_x \\
&= -\sum_{\alpha} \int_{\Omega^+} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} : \nabla \left(\sum_i^{N_w} \hat{\mathbf{n}}_i w_i \right) dV_x \\
&= -\sum_{\alpha} \int_{\Omega^+} \eta_{\alpha} \boldsymbol{\sigma}_{\alpha} : \nabla \mathbf{n} dV_x \\
&= 0.
\end{aligned} \tag{1.35}$$

1.6 The reference element

Figure 1.1: Schematic of the three domains Ω_r , $\Omega^{(e_p)}(t, \Omega_r)$, $\Omega^{(e_p)}(0, \Omega_r)$.

We have generally been operating in physical space, where the domain of interest is labelled as Ω^+ , which changes in time according to the evolution of the flow. This domain has been discretized into finite elements, and in this section we'll denote a finite element using the variable e_p . We now introduce the reference element as the unit square in 2D or the unit cube in 3D, which is constant

in time, and label its domain as Ω_r . The function $\Phi^{(e_p)} = \Phi^{(e_p)}(t, \mathbf{r})$ maps from points \mathbf{r} in Ω_r to points in the finite element e_p of the physical space. The evolving domain of the finite element e_p is given by the function $\Omega^{(e_p)} = \Omega^{(e_p)}(t, \Omega_r)$. A depiction of these domains and their mappings is shown in fig. 1.1. One caveat to highlight: whereas for Ω^+ we had $\Omega^+(0, \Omega_0) = \Omega_0$, for $\Omega^{(e_p)}$ the analogue does not hold, that is, $\Omega^{(e_p)}(0, \Omega_r) \neq \Omega_r$.

The mapping functions $\Phi^{(e_p)}$ and \mathbf{x}^+ are related to each other as follows

$$\Phi^{(e_p)}(t, \mathbf{r}) = \mathbf{x}^+(t, \Phi^{(e_p)}(0, \mathbf{r})). \quad (1.36)$$

The Jacobian $\mathbf{J}^{(e_p)} = \mathbf{J}^{(e_p)}(t, \mathbf{r})$ is defined as

$$\mathbf{J}^{(e_p)} = \frac{\partial \Phi^{(e_p)}}{\partial \mathbf{r}}, \quad (1.37)$$

with its determinant labeled as $J^{(e_p)} = J^{(e_p)}(t, \mathbf{r})$. Using eq. (1.36) in the definition of $\mathbf{J}^{(e_p)}$ we get

$$\begin{aligned} \mathbf{J}^{(e_p)} &= \left(\frac{\partial \mathbf{x}^+}{\partial \mathbf{y}} \right)_{\mathbf{y}=\Phi^{(e_p)}(0, \mathbf{r})} \frac{\partial \Phi^{(e_p)}(0, \mathbf{r})}{\partial \mathbf{r}} \\ &= (\mathbf{J}^+)_{\mathbf{y}=\Phi^{(e_p)}(0, \mathbf{r})} \mathbf{J}_0^{(e_p)}, \end{aligned}$$

where $\mathbf{J}_0^{(e_p)} = \mathbf{J}^{(e_p)}(0, \mathbf{r})$. Taking the determinant of the above gives

$$J^{(e_p)} = (J^+)_{\mathbf{y}=\Phi^{(e_p)}(0, \mathbf{r})} J_0^{(e_p)}, \quad (1.38)$$

where $J_0^{(e_p)} = J^{(e_p)}(0, \mathbf{r})$.

As a reminder, a Lagrangian variable $f^+ = f^+(t, \mathbf{y})$ is related to $f = f(t, \mathbf{x})$ according to

$$f^+(t, \mathbf{y}) = f(t, \mathbf{x}^+(t, \mathbf{y})). \quad (1.39)$$

In an analogous manner, a function $f^{(e_p)} = f^{(e_p)}(t, \mathbf{r})$ for finite element e_p is defined as follows

$$f^{(e_p)}(t, \mathbf{r}) = f(t, \Phi^{(e_p)}(t, \mathbf{r})). \quad (1.40)$$

We can also use eq. (1.36) to combine eqs. (1.39) and (1.40) and thus obtain

$$f^{(e_p)}(t, \mathbf{r}) = f(t, \Phi^{(e_p)}(t, \mathbf{r})) = f(t, \mathbf{x}^+(t, \Phi^{(e_p)}(0, \mathbf{r}))) = f^+(t, \Phi^{(e_p)}(0, \mathbf{r})). \quad (1.41)$$

Examples of these reference-element functions include those for material density $\rho_\alpha^{(e_p)} = \rho_\alpha^{(e_p)}(t, \mathbf{r})$, velocity $\mathbf{u}^{(e_p)} = \mathbf{u}^{(e_p)}(t, \mathbf{r})$, and material internal energy $e_\alpha^{(e_p)} = e_\alpha^{(e_p)}(t, \mathbf{r})$. Using integration by substitution and then eq. (1.40) we show that

$$\begin{aligned} \int_{\Omega^{(e_p)}} f dV_x &= \int_{\Omega_r} f(t, \Phi^{(e_p)}(t, \mathbf{r})) J^{(e_p)} dV_r \\ &= \int_{\Omega_r} f^{(e_p)} J^{(e_p)} dV_r. \end{aligned}$$

In other words, integrals over elements at any time can be computed as integrals over the reference space.

If the integrand contains a derivative, a bit of extra care is required. To show this, we'll use index notation for the sake of clarity. Consider as an example a term of the form

$$(\boldsymbol{\sigma} \cdot \nabla f)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}} = \left(\sigma_{ij} \frac{\partial f}{\partial x_j} \right)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}} = \sigma_{ij}^{(e_p)} \left(\frac{\partial f}{\partial x_j} \right)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}}.$$

We first note that

$$\frac{\partial f^{(e_p)}}{\partial r_k} = \left(\frac{\partial f}{\partial x_i} \right)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}} \frac{\partial \Phi_i^{(e_p)}}{\partial r_k} = \left(\frac{\partial f}{\partial x_i} \right)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}} J_{ik}^{(e_p)}.$$

Upon multiplying both sides by the inverse of $\mathbf{J}^{(e_p)}$, we get

$$\left(\frac{\partial f}{\partial x_j} \right)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}} = \frac{\partial f^{(e_p)}}{\partial r_k} \left(J^{(e_p)} \right)_{kj}^{-1}.$$

Thus, we now have

$$(\boldsymbol{\sigma} \cdot \nabla f)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}} = \sigma_{ij}^{(e_p)} \frac{\partial f^{(e_p)}}{\partial r_k} \left(J^{(e_p)} \right)_{kj}^{-1} = \sigma_{ij}^{(e_p)} \left[\left(J^{(e_p)} \right)^{-1} \right]_{jk}^T \frac{\partial f^{(e_p)}}{\partial r_k}.$$

In vector/tensor notation, the above is written as

$$(\boldsymbol{\sigma} \cdot \nabla f)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}} = \boldsymbol{\sigma}^{(e_p)} \cdot \left[\left(\mathbf{J}^{(e_p)} \right)^{-1} \right]^T \cdot \nabla_{\mathbf{r}} f^{(e_p)}.$$

Thus, for the force matrix \mathbf{f}_{ij} we can now write

$$\begin{aligned} \int_{\Omega^{(e_p)}} \boldsymbol{\sigma} \cdot \nabla w_i \phi_j dV_x &= \int_{\Omega_{\mathbf{r}}} (\boldsymbol{\sigma} \cdot \nabla w_i \phi_j)_{\mathbf{x}=\boldsymbol{\Phi}^{(e_p)}} J^{(e_p)} dV_r \\ &= \int_{\Omega_{\mathbf{r}}} \boldsymbol{\sigma}^{(e_p)} \cdot \left[\left(\mathbf{J}^{(e_p)} \right)^{-1} \right]^T \cdot \nabla_{\mathbf{r}} w_i^{(e_p)} \phi_j^{(e_p)} J^{(e_p)} dV_r. \end{aligned}$$

We also note that we can evaluate eq. (1.21) at $\mathbf{y} = \boldsymbol{\Phi}^{(e_p)}(0, \mathbf{r})$ and use eq. (1.41) to obtain

$$\eta_{\alpha}^{(e_p)} \rho_{\alpha}^{(e_p)} = \frac{\eta_{\alpha,0}^{(e_p)} \rho_{\alpha,0}^{(e_p)}}{(J^+)_{\mathbf{y}=\boldsymbol{\Phi}^{(e_p)}(0,\mathbf{r})}}.$$

Using eq. (1.38) the above becomes

$$\eta_{\alpha}^{(e_p)} \rho_{\alpha}^{(e_p)} = \frac{\eta_{\alpha,0}^{(e_p)} \rho_{\alpha,0}^{(e_p)} J_0^{(e_p)}}{J^{(e_p)}}.$$

As with the other variables, we can define a reference basis function $w^{(e_p)}$ so that it satisfies

$$w_j^{(e_p)}(t, \mathbf{r}) = w_j^+(t, \boldsymbol{\Phi}^{(e_p)}(0, \mathbf{r})). \quad (1.42)$$

Now, as mentioned earlier, the Lagrangian basis functions are independent of time, and as a result the reference basis functions are so as well. That is, $w^{(e_p)} = w^{(e_p)}(\mathbf{r})$. Consider the expansion in eq. (1.13). Plugging in $\boldsymbol{\Phi}^{(e_p)}(0, \mathbf{r})$ for \mathbf{y} gives

$$\boldsymbol{\Phi}^{(e_p)} = \sum_j^{N_w} \hat{\mathbf{x}}_j w_j^{(e_p)}. \quad (1.43)$$

Thus, both the Lagrangian and reference variables share the same finite-element coefficients.

1.7 Temporal integration

We now integrate forward in time the semi-discrete eqs. (1.17), (1.26) and (1.30), which we repeat below for convenience

$$\mathbf{M}_\mathcal{V} \frac{d\mathbf{U}}{dt} = - \sum_{\alpha} \mathbf{F}_{\alpha} \hat{\mathbf{1}}. \quad (1.26)$$

$$\mathbf{M}_{\mathcal{E},\alpha} \frac{d\mathbf{E}_{\alpha}}{dt} = \mathbf{F}_{\alpha}^T \cdot \mathbf{U} - \mathbf{C}_{\alpha}. \quad (1.30)$$

$$\frac{d\mathbf{X}}{dt} = \mathbf{U}. \quad (1.17)$$

The equations are integrated using the RK2-average scheme of Dobrev et al. [2012], which consists of the following for the first stage

$$\begin{aligned} \mathbf{U}^{n+1/2} &= \mathbf{U}^n - \frac{\Delta t}{2} (\mathbf{M}_\mathcal{V})^{-1} \sum_{\alpha} \mathbf{F}_{\alpha}^n \hat{\mathbf{1}}, \\ \mathbf{E}_{\alpha}^{n+1/2} &= \mathbf{E}_{\alpha}^n + \frac{\Delta t}{2} (\mathbf{M}_{\mathcal{E},\alpha})^{-1} \left[(\mathbf{F}_{\alpha}^n)^T \cdot \mathbf{U}^{n+1/2} - \mathbf{C}_{\alpha}^n \right], \\ \mathbf{X}^{n+1/2} &= \mathbf{X}^n + \frac{\Delta t}{2} \mathbf{U}^{n+1/2}, \end{aligned} \quad (1.44)$$

and the following for the second stage

$$\begin{aligned} \mathbf{U}^{n+1} &= \mathbf{U}^n - \Delta t (\mathbf{M}_\mathcal{V})^{-1} \sum_{\alpha} \mathbf{F}_{\alpha}^{n+1/2} \hat{\mathbf{1}}, \\ \mathbf{E}_{\alpha}^{n+1} &= \mathbf{E}_{\alpha}^n + \Delta t (\mathbf{M}_{\mathcal{E},\alpha})^{-1} \left[\left(\mathbf{F}_{\alpha}^{n+1/2} \right)^T \cdot \bar{\mathbf{U}}^{n+1/2} - \mathbf{C}_{\alpha}^{n+1/2} \right], \\ \mathbf{X}^{n+1} &= \mathbf{X}^n + \Delta t \bar{\mathbf{U}}^{n+1/2}. \end{aligned} \quad (1.45)$$

In the above, $\bar{\mathbf{U}}^{n+1/2} = (\mathbf{U}^n + \mathbf{U}^{n+1})/2$. In particular, this scheme is used since it conserves total energy, that is, $(\sum_{\alpha} IE_{\alpha} + KE)^{n+1} - (\sum_{\alpha} IE_{\alpha} + KE)^n = 0$. To prove this we first show that for the internal energy we have

$$\begin{aligned} IE_{\alpha}^{n+1} - IE_{\alpha}^n &= \hat{\mathbf{1}}^T \mathbf{M}_{\mathcal{E},\alpha} (\mathbf{E}_{\alpha}^{n+1} - \mathbf{E}_{\alpha}^n) \\ &= \Delta t \hat{\mathbf{1}}^T \left[\left(\mathbf{F}_{\alpha}^{n+1/2} \right)^T \cdot \bar{\mathbf{U}}^{n+1/2} - \mathbf{C}_{\alpha}^{n+1/2} \right]. \end{aligned}$$

Summing over all alpha gives

$$\sum_{\alpha} IE_{\alpha}^{n+1} - \sum_{\alpha} IE_{\alpha}^n = \Delta t \hat{\mathbf{1}}^T \left(\sum_{\alpha} \mathbf{F}_{\alpha}^{n+1/2} \right)^T \cdot \bar{\mathbf{U}}^{n+1/2}. \quad (1.46)$$

For the kinetic energy we have

$$\begin{aligned}
KE^{n+1} - KE^n &= \frac{1}{2} \left[(\mathbf{U}^{n+1})^T \cdot \mathbf{M}_V \mathbf{U}^{n+1} - (\mathbf{U}^n)^T \cdot \mathbf{M}_V \mathbf{U}^n \right] \\
&= \frac{1}{2} \left[(\mathbf{U}^{n+1})^T \mathbf{M}_V \cdot \mathbf{U}^{n+1} - (\mathbf{U}^n)^T \mathbf{M}_V \cdot \mathbf{U}^n \right] \\
&= \frac{1}{2} (\mathbf{U}^{n+1} - \mathbf{U}^n)^T \mathbf{M}_V \cdot (\mathbf{U}^{n+1} + \mathbf{U}^n) \\
&= (\mathbf{U}^{n+1} - \mathbf{U}^n)^T \mathbf{M}_V \cdot \bar{\mathbf{U}}^{n+1/2} \\
&= \left[-\Delta t (\mathbf{M}_V)^{-1} \sum_{\alpha} \mathbf{F}_{\alpha}^{n+1/2} \hat{\mathbf{1}} \right]^T \mathbf{M}_V \cdot \bar{\mathbf{U}}^{n+1/2} \\
&= -\Delta t \hat{\mathbf{1}}^T \left(\sum_{\alpha} \mathbf{F}_{\alpha}^{n+1/2} \right)^T \left[(\mathbf{M}_V)^{-1} \right]^T \mathbf{M}_V \cdot \bar{\mathbf{U}}^{n+1/2} \\
&= -\Delta t \hat{\mathbf{1}}^T \left(\sum_{\alpha} \mathbf{F}_{\alpha}^{n+1/2} \right)^T \left[(\mathbf{M}_V)^T \right]^{-1} \mathbf{M}_V \cdot \bar{\mathbf{U}}^{n+1/2} \\
&= -\Delta t \hat{\mathbf{1}}^T \left(\sum_{\alpha} \mathbf{F}_{\alpha}^{n+1/2} \right)^T (\mathbf{M}_V)^{-1} \mathbf{M}_V \cdot \bar{\mathbf{U}}^{n+1/2} \\
&= -\Delta t \hat{\mathbf{1}}^T \left(\sum_{\alpha} \mathbf{F}_{\alpha}^{n+1/2} \right)^T \cdot \bar{\mathbf{U}}^{n+1/2}. \tag{1.47}
\end{aligned}$$

Thus, adding eq. (1.46) and eq. (1.47) leads to total energy conservation.

Chapter 2

The Re-mesh Step

Figure 2.1: Schematic of the four domains Ω_r , $\Omega^{(e_p)}(t, \Omega_r)$, $\Omega^{(e_p)}(0, \Omega_r)$, $\Omega^{(e_t)}(t, \Omega_r)$.

We introduce a new space, the target space, which is divided into target elements, where each corresponds to a physical element e_p . Consider a mapping $\Phi^{(e_t)} = \Phi^{(e_t)}(t, \mathbf{r})$ from a point \mathbf{r} in the reference element to a point in the target element. Also consider the mapping $\mathbf{x}^- = \mathbf{x}^-(t, \mathbf{z})$ from a point \mathbf{z} in the target space to a point in the physical space. Note that $\Phi^{(e_p)}$, $\Phi^{(e_t)}$, and \mathbf{x}^- are related to each other according to

$$\Phi^{(e_p)}(t, \mathbf{r}) = \mathbf{x}^-(t, \Phi^{(e_t)}(t, \mathbf{r})). \quad (2.1)$$

We define the Jacobians as follows

$$\mathbf{J}^{(e_t)} = \frac{\partial \Phi^{(e_t)}}{\partial \mathbf{r}}, \quad (2.2)$$

$$\mathbf{J}^- = \frac{\partial \mathbf{x}^-}{\partial \mathbf{z}}. \quad (2.3)$$

where $\mathbf{J}^{(e_t)} = \mathbf{J}^{(e_t)}(t, \mathbf{r})$ and $\mathbf{J}^- = \mathbf{J}^-(t, \mathbf{z})$. Taking the derivative of eq. (2.1) we get

$$\frac{\partial \Phi^{(e_p)}}{\partial \mathbf{r}} = \left(\frac{\partial \mathbf{x}^-}{\partial \mathbf{z}} \right)_{\mathbf{z}=\Phi^{(e_t)}} \frac{\partial \Phi^{(e_t)}}{\partial \mathbf{r}},$$

which we write as

$$\mathbf{J}^{(e_p)} = (\mathbf{J}^-)_{\mathbf{z}=\Phi^{(e_t)}} \mathbf{J}^{(e_t)}.$$

Multiplying both sides by the inverse of $\mathbf{J}^{(e_t)}$ we finally get

$$(\mathbf{J}^-)_{\mathbf{z}=\Phi^{(e_t)}} = \mathbf{J}^{(e_p)} \left(\mathbf{J}^{(e_t)} \right)^{-1}. \quad (2.4)$$

Combining eq. (1.36) and eq. (2.1) we get

$$\mathbf{x}^-(t, \Phi^{(e_t)}(t, \mathbf{r})) = \mathbf{x}^+(t, \Phi^{(e_p)}(0, \mathbf{r})). \quad (2.5)$$

We also define a target basis function $w^{(e_t)} = w^{(e_t)}(t, \mathbf{z})$ so that it satisfies

$$w^-(t, \Phi^{(e_t)}(t, \mathbf{r})) = w^+(t, \Phi^{(e_p)}(0, \mathbf{r})). \quad (2.6)$$

Consider the expansion in eq. (1.13). Plugging in $\Phi^{(e_p)}(0, \mathbf{r})$ for \mathbf{y} gives

$$\mathbf{x}^-(t, \Phi^{(e_t)}(t, \mathbf{r})) = \sum_j^{N_w} \hat{\mathbf{x}} w^-(t, \Phi^{(e_t)}(t, \mathbf{r})).$$

Assuming this holds for any $\Phi^{(e_t)}$ we get

$$\mathbf{x}^- = \sum_j^{N_w} \hat{\mathbf{x}} w^-. \quad (2.7)$$

Thus, both the Lagrangian and the target variables share the same finite-element coefficients.

To obtain the relaxed mesh, one minimizes the following function

$$F(\mathbf{X}) = \sum_{e_t \in \mathcal{M}_t} \int_{\Omega^{(e_t)}} \mu(\mathbf{J}^-) dV_z \quad (2.8)$$
