## 1 Lagrangian governing equations

We consider Lagrangian fluid particles, for which we define the position  $\mathbf{x}^+ = \mathbf{x}^+(t, \mathbf{y})$ , the density  $\rho^+ = \rho^+(t, \mathbf{y})$ , the velocity  $\mathbf{u}^+ = \mathbf{u}^+(t, \mathbf{y})$ , and the internal energy  $e^+ = e^+(t, \mathbf{y})$ , where  $\mathbf{y}$  is the location of each fluid particle at time zero. The Eulerian counterparts for the density, velocity, and internal energy are, respectively,  $\rho = \rho(t, \mathbf{x})$ ,  $\mathbf{u} = \mathbf{u}(t, \mathbf{x})$ , and  $e = e(t, \mathbf{x})$ . Also consider the volume  $\Omega_0$  as the set of all  $\mathbf{y}$  vectors that make up the initial domain. The control volume  $\Omega^+ = \Omega^+(t, \Omega_0)$  is then defined by

$$\Omega^+ = \{ \mathbf{x}^+ : \mathbf{y} \in \Omega_0 \}. \tag{1}$$

Note that  $\Omega^+(0,\Omega_0) = \Omega_0$ .

The governing equations for the Lagrangian fluid particles are derived in my fluid-mechanics notes (see section on kinematics, Lagrangian governing equations, etc.). These are shown below

$$\frac{\partial \mathbf{x}^+}{\partial t} = \mathbf{u}^+,\tag{2}$$

$$\frac{\partial J^+ \rho^+}{\partial t} = 0,\tag{3}$$

$$\rho^{+} \frac{\partial \mathbf{u}^{+}}{\partial t} = (\nabla \cdot \boldsymbol{\sigma})_{\mathbf{x} = \mathbf{x}^{+}}, \tag{4}$$

$$\rho^{+} \frac{\partial e^{+}}{\partial t} = (\boldsymbol{\sigma} : \nabla \mathbf{u})_{\mathbf{x} = \mathbf{x}^{+}}. \tag{5}$$

In the above,  $\sigma = \sigma(t, \mathbf{x})$  is the stress tensor, and  $J^+ = J^+(t, \mathbf{y})$  is the determinant of the Jacobian matrix  $\mathbf{J}^+ = \mathbf{J}^+(t, \mathbf{y})$ , which itself is defined as  $\mathbf{J}^+ = \partial \mathbf{x}^+/\partial \mathbf{y}$ .

A note on notation. The products that involve a tensor au can be expressed in Einstein notation as

$$\nabla \cdot \boldsymbol{\tau} = \frac{\partial \tau_{ij}}{\partial x_i},\tag{6}$$

$$\boldsymbol{\tau} \cdot \nabla \alpha = \tau_{ij} \frac{\partial \alpha}{\partial x_j},\tag{7}$$

$$\mathbf{f} \cdot \boldsymbol{\tau} \cdot \nabla \alpha = f_i \tau_{ij} \frac{\partial \alpha}{\partial x_j},\tag{8}$$

$$\boldsymbol{\tau} : \nabla \mathbf{f} = \tau_{ij} \frac{\partial f_i}{\partial x_i}. \tag{9}$$

where  $\alpha$  is a scalar and  $\mathbf{f}$  a vector. In these notes we'll mostly be using indices i and j for FE expansions, rather than for Einstein notation.

## 2 Lagrangian finite elements

We introduce a Lagrangian basis function  $\Phi_i^+ = \Phi_i^+(t, \mathbf{y})$  and an Eulerian basis function  $\Phi_i = \Phi_i(t, \mathbf{x})$ . These are related to each other as any other Lagrangian-Eulerian pair, namely

$$\Phi_i^+(t, \mathbf{y}) = \Phi_i(t, \mathbf{x}^+(t, \mathbf{y})). \tag{10}$$

We now introduce the Lagrangian variable  $f^+ = f^+(t, \mathbf{y})$  and the Eulerian counterpart  $f = f(t, \mathbf{x})$ , and they also satisfy

$$f^{+}(t, \mathbf{y}) = f(t, \mathbf{x}^{+}(t, \mathbf{y})). \tag{11}$$

The expansion of an Eulerian variable in terms of basis functions is as follows

$$f = \sum_{i}^{n} F_i \Phi_i, \tag{12}$$

where  $F_i = F_i(t)$ . Plugging in  $\mathbf{x}^+$  for  $\mathbf{x}$  in the above, and using eqs. (10) and (11) gives

$$f^{+} = \sum_{i}^{n} F_i \Phi_i^{+}. \tag{13}$$

Thus, both the Lagrangian and Eulerian variables share the same finite-element coefficients  $F_i$ . As shown in my fluid mechanics notes, we also have

$$\frac{\partial \Phi_i^+}{\partial t} = \left(\frac{\partial \Phi_i}{\partial t} + \mathbf{u} \cdot \nabla \Phi_i\right)_{\mathbf{x} = \mathbf{x}^+},\tag{14}$$

where  $\mathbf{u} = \mathbf{u}(t, \mathbf{x})$  is the Eulerian counterpart to  $\mathbf{u}^+$ . We'll introduce the restriction that  $\Phi_i^+$  is constant in time, that is  $\partial \Phi_i^+/\partial t = 0$ , which gives

$$\frac{\partial \Phi_i}{\partial t} + \mathbf{u} \cdot \nabla \Phi_i = 0. \tag{15}$$

Thus,  $F_i$  in eq. (13) accounts for the time dependence of  $F^+$ , whereas  $\Phi_i^+$  accounts for the dependence on  $\mathbf{y}$ .

# 3 Finite element expansion

We introduce the coefficients  $\hat{\mathbf{x}}_i = \hat{\mathbf{x}}_i(t)$ ,  $\hat{\mathbf{u}}_i = \hat{\mathbf{u}}_i(t)$  and  $\hat{e}_i = \hat{e}_i(t)$ , as well as the Lagrangian basis functions  $\phi_i^+ = \phi_i^+(\mathbf{y}) \in L^2$ , and  $w_i^+ = w_i^+(\mathbf{y}) \in H^1$ . We note that  $\hat{\mathbf{x}}_i$  and  $\hat{\mathbf{u}}_i$  are each vectors, e.g., the components of  $\hat{\mathbf{u}}_i$  are  $\hat{u}_{i,\alpha} = \hat{u}_{i,\alpha}(t)$  for  $\alpha = x, y, z$ . We also note that  $\phi_i^+$  and  $w_i^+$  have Eulerian counterparts  $\phi_i = \phi_i(t, \mathbf{x})$  and  $w_i = w_i(t, \mathbf{x})$ , respectively. The coefficients are used in the following expansions

$$\mathbf{x}^+ = \sum_{j}^{N_w} \hat{\mathbf{x}}_j w_j^+, \tag{16}$$

$$\mathbf{u}^+ = \sum_{j}^{N_w} \hat{\mathbf{u}}_j w_j^+,\tag{17}$$

$$e^{+} = \sum_{j}^{N_{\phi}} \hat{e}_{j} \phi_{j}^{+}. \tag{18}$$

We note that the expansion coefficients are the same for the Lagrangian and Eulerian variables, as shown in section 2. For example, for the Eulerian velocity, we have

$$\mathbf{u} = \sum_{j}^{N_w} \hat{\mathbf{u}}_j w_j. \tag{19}$$

## 4 Semi-discrete Lagrangian governing equations

#### 4.1 Position and Jacobian

Plugging in eqs. (16) and (17) in eq. (2) gives

$$\sum_{j}^{N_{w}} \frac{d\hat{\mathbf{x}}_{j}}{dt} w_{j}^{+} = \sum_{j}^{N_{w}} \hat{\mathbf{u}}_{j} w_{j}^{+}.$$
 (20)

To satisfy the equation above, we'll require

$$\frac{d\hat{\mathbf{x}}_j^+}{dt} = \hat{\mathbf{u}}_j. \tag{21}$$

We now introduce the vectors **X** and **U**, whose components are  $\hat{\mathbf{x}}_i$  and  $\hat{\mathbf{u}}_i$ , respectively. Thus, the above is written as

$$\frac{d\mathbf{X}}{dt} = \mathbf{U}.\tag{22}$$

To obtain  $\mathbf{J}^+$  we plug in eq. (16) into its definition, that is

$$\mathbf{J}^{+} = \frac{\partial}{\partial \mathbf{y}} \sum_{j}^{N_{w}} \hat{\mathbf{x}}_{j} w_{j}^{+} = \sum_{j}^{N_{w}} \hat{\mathbf{x}}_{j} \nabla_{\mathbf{y}} w_{j}^{+}. \tag{23}$$

Note that for any function  $\mathbf{x}^+$ , whether it be an exact analytical expression or a finite-element expansion as given by eq. (16), one can derive the following equation for the determinant of the Jacobian

$$\frac{\partial J^{+}}{\partial t} = J^{+} \left( \frac{\partial u_{k}}{\partial x_{k}} \right)_{\mathbf{x} = \mathbf{x}^{+}}, \tag{24}$$

In the above  $\mathbf{u}$  is the Eulerian counterpart to  $\mathbf{u}^+$ , which is given by eq. (2).

#### 4.2 Density

Equation (3) allows us to write

$$\rho^{+} = \frac{\rho_0^{+}}{J^{+}},\tag{25}$$

where  $\rho_0^+ = \rho^+(0, \mathbf{y})$ .

### 4.3 Velocity

Plugging in eq. (25) in eq. (4) we get

$$\rho_0^+ \frac{\partial \mathbf{u}^+}{\partial t} = (\nabla \cdot \boldsymbol{\sigma})_{\mathbf{x} = \mathbf{x}^+} J^+. \tag{26}$$

We then multiply both sides of the above by the basis functions for velocity and integrate over all space to obtain

$$\int_{\Omega_0} \rho_0^+ \frac{\partial \mathbf{u}^+}{\partial t} w_i^+ dV_y = \int_{\Omega_0} (\nabla \cdot \boldsymbol{\sigma})_{\mathbf{x} = \mathbf{x}^+} w_i^+ J^+ dV_y.$$
 (27)

For the left-hand side we have

$$\int_{\Omega_{0}} \rho_{0}^{+} \frac{\partial \mathbf{u}^{+}}{\partial t} w_{i}^{+} dV_{y} = \int_{\Omega_{0}} \rho_{0}^{+} \sum_{j}^{N_{w}} \frac{d\hat{\mathbf{u}}_{j}}{dt} w_{j}^{+} w_{i}^{+} dV_{y},$$

$$= \sum_{j}^{N_{w}} \frac{d\hat{\mathbf{u}}_{j}}{dt} \int_{\Omega_{0}} \rho_{0}^{+} w_{i}^{+} w_{j}^{+} dV_{y},$$

$$= \sum_{j}^{N_{w}} \frac{d\hat{\mathbf{u}}_{j}}{dt} m_{ij}^{(w)},$$
(28)

where

$$m_{ij}^{(w)} = \int_{\Omega_0} \rho_0^+ w_i^+ w_j^+ dV_y \tag{29}$$

is a mass bilinear form (which is independent of time). For the right-hand side we have

$$\int_{\Omega_0} (\nabla \cdot \boldsymbol{\sigma})_{\mathbf{x} = \mathbf{x}^+} w_i^+ J^+ dV_y = \int_{\Omega_0} (\nabla \cdot \boldsymbol{\sigma} w_i)_{\mathbf{x} = \mathbf{x}^+} J^+ dV_y$$

$$= \int_{\Omega^+} \nabla \cdot \boldsymbol{\sigma} w_i dV_x$$

$$= -\int_{\Omega^+} \boldsymbol{\sigma} \cdot \nabla w_i dV_x. \tag{30}$$

The second equality above follows from integration by substitution. Combining results we have

$$\sum_{j}^{N_w} \frac{d\hat{\mathbf{u}}_j}{dt} m_{ij}^{(w)} = -\int_{\Omega^+} \boldsymbol{\sigma} \cdot \nabla w_i \, dV_x. \tag{31}$$

We introduce the matrix  $\mathbf{M}^{(w)}$  whose components are  $m_{ij}^{(w)}$ . Thus, the left-hand side of eq. (31) can be written as  $\mathbf{M}^{(w)} d\mathbf{U}/dt$ . We also introduce the vector bilinear form

$$\mathbf{f}_{ij} = \int_{\Omega^+} \boldsymbol{\sigma} \cdot \nabla w_i \phi_j \, dV_x. \tag{32}$$

This is a *vector* bilinear form since  $\mathbf{f}_{ij}$  has components  $f_{ij,\alpha} = f_{ij,\alpha}(t)$ , for  $\alpha = x, y, z$ , where  $\alpha$  denotes the first index of  $\sigma$ . We introduce the matrix  $\mathbf{F}$ , whose components are  $\mathbf{f}_{ij}$ . We also

expand the field with constant value of one as follows

$$1 = \sum_{i}^{N_{\phi}} \hat{c}_i \phi_i. \tag{33}$$

If we define the vector **C** as that with components  $\hat{c}_i$ , we can show that

$$\mathbf{FC} = \sum_{j}^{N_{\phi}} \mathbf{f}_{ij} \hat{c}_{j}$$

$$= \sum_{j}^{N_{\phi}} \int_{\Omega^{+}} \boldsymbol{\sigma} \cdot \nabla w_{i} \phi_{j} \, dV_{x} \hat{c}_{j}$$

$$= \int_{\Omega^{+}} \boldsymbol{\sigma} \cdot \nabla w_{i} \left( \sum_{j}^{N_{\phi}} \hat{c}_{j} \phi_{j} \right) \, dV_{x}$$

$$= \int_{\Omega^{+}} \boldsymbol{\sigma} \cdot \nabla w_{i} \, dV_{x}. \tag{34}$$

The above is the negative of the right-hand side of eq. (31). Thus, combining all together we get

$$\mathbf{M}^{(w)}\frac{d\mathbf{U}}{dt} = -\mathbf{FC}.\tag{35}$$

We note that since both the Lagrangian and Eulerian velocities share the same coefficients  $\mathbf{U}$ , we now have a solution for both.

### 4.4 Energy

Plugging in eq. (25) in eq. (5) we get

$$\rho_0^+ \frac{\partial e^+}{\partial t} = (\boldsymbol{\sigma} : \nabla \mathbf{u})_{\mathbf{x} = \mathbf{x}^+} J^+.$$
(36)

We then multiply both sides of the above by the basis functions for energy and integrate over all space to obtain

$$\int_{\Omega_0} \rho_0^+ \frac{\partial e^+}{\partial t} \phi_i^+ dV_y = \int_{\Omega_0} (\boldsymbol{\sigma} : \nabla \mathbf{u})_{\mathbf{x} = \mathbf{x}^+} \phi_i^+ J^+ dV_y.$$
 (37)

For the left-hand side we have

$$\int_{\Omega_{0}} \rho_{0}^{+} \frac{\partial e^{+}}{\partial t} \phi_{i}^{+} dV_{y} = \int_{\Omega_{0}} \rho_{0}^{+} \sum_{j}^{N_{\phi}} \frac{d\hat{e}_{j}}{dt} \phi_{j}^{+} \phi_{i}^{+} dV_{y},$$

$$= \sum_{j}^{N_{\phi}} \frac{d\hat{e}_{j}}{dt} \int_{\Omega_{0}} \rho_{0}^{+} \phi_{j}^{+} \phi_{i}^{+} dV_{y},$$

$$= \sum_{j}^{N_{\phi}} \frac{d\hat{e}_{j}}{dt} m_{ij}^{(\phi)} \tag{38}$$

where

$$m_{ij}^{(\phi)} = \int_{\Omega_0} \rho_0^+ \phi_j^+ \phi_i^+ dV_y \tag{39}$$

is a mass bilinear form (which is independent of time). For the right-hand side we have

$$\int_{\Omega_0} (\boldsymbol{\sigma} : \nabla \mathbf{u})_{\mathbf{x} = \mathbf{x}^+} \phi_i^+ J^+ dV_y = \int_{\Omega_0} (\boldsymbol{\sigma} : \nabla \mathbf{u} \phi_i)_{\mathbf{x} = \mathbf{x}^+} J^+ dV_y$$

$$= \int_{\Omega^+} \boldsymbol{\sigma} : \nabla \mathbf{u} \phi_i dV_x. \tag{40}$$

Combining results we have

$$\sum_{j}^{N_{\phi}} \frac{d\hat{e}_{j}}{dt} m_{ij}^{(\phi)} = \int_{\Omega^{+}} \boldsymbol{\sigma} : \nabla \mathbf{u} \phi_{i} \, dV_{x}. \tag{41}$$

We no show that

$$\boldsymbol{\sigma} : \nabla \mathbf{u} = \boldsymbol{\sigma} : \nabla \left( \sum_{k=0}^{N_w} \hat{\mathbf{u}}_k w_k \right) = \sum_{k=0}^{N_w} \hat{\mathbf{u}}_k \cdot \boldsymbol{\sigma} \cdot \nabla w_k, \tag{42}$$

and hence the previous result is written as

$$\sum_{j}^{N_{\phi}} \frac{d\hat{e}_{j}}{dt} m_{ij}^{(\phi)} = \sum_{k}^{N_{w}} \hat{\mathbf{u}}_{k} \cdot \int_{\Omega^{+}} \boldsymbol{\sigma} \cdot \nabla w_{k} \phi_{i} \, dV_{x}. \tag{43}$$

The above is finally re-written as

$$\sum_{i}^{N_{\phi}} \frac{d\hat{e}_{j}}{dt} m_{ij}^{(\phi)} = \sum_{k}^{N_{w}} \hat{\mathbf{u}}_{k} \cdot \mathbf{f}_{ki}. \tag{44}$$

Note that in the above there is a dot product in the right-hand side, that is, the right-hand side expanded out is

$$\sum_{k}^{N_w} \hat{\mathbf{u}}_k \cdot \mathbf{f}_{ki} = \sum_{k}^{N_w} \sum_{\alpha = x, y, z} \hat{u}_{k,\alpha} f_{ki,\alpha}. \tag{45}$$

We now introduce the vector **E** whose components are  $\hat{e}_i$ . We also introduce the matrix  $\mathbf{M}^{(\phi)}$  whose components are  $m_{ij}^{(\phi)}$ . Thus, eq. (44) can be succinctly written as

$$\mathbf{M}^{(\phi)} \frac{d\mathbf{E}}{dt} = \mathbf{F}^T \cdot \mathbf{U}. \tag{46}$$

Note again that on the right-hand side above there is a matrix-vector product *and* a dot product. We also note that since both the Lagrangian and Eulerian internal energies share the same coefficients **E**, we now have a solution for both.

## 5 Momentum and energy conservation

We'll now define the internal energy IE = IE(t), the kinetic energy KE = KE(t), and the momentum  $P_{\mathbf{n}} = P_{\mathbf{n}}(t)$  along a constant  $\mathbf{n}$  direction.

$$IE = \int_{\Omega^{+}} \rho e \, dV_{x}$$

$$= \int_{\Omega_{0}} \rho^{+} e^{+} J^{+} \, dV_{y}$$

$$= \int_{\Omega_{0}} \rho_{0}^{+} e^{+} \, dV_{y}$$

$$= \int_{\Omega_{0}} \rho_{0}^{+} \sum_{j}^{N_{\phi}} \hat{e}_{j} \phi_{j}^{+} \, dV_{y}$$

$$= \int_{\Omega_{0}} \rho_{0}^{+} \sum_{j}^{N_{\phi}} \hat{e}_{j} \phi_{j}^{+} \left( \sum_{i}^{N_{\phi}} \hat{c}_{i} \phi_{i}^{+} \right) \, dV_{y}$$

$$= \sum_{i}^{N_{\phi}} \sum_{j}^{N_{\phi}} \hat{c}_{i} \int_{\Omega_{0}} \rho_{0}^{+} \phi_{i}^{+} \phi_{j}^{+} \, dV_{y} \hat{e}_{j}$$

$$= \sum_{i}^{N_{\phi}} \sum_{j}^{N_{\phi}} \hat{c}_{i} m_{ij}^{(\phi)} \hat{e}_{j}$$

$$= \mathbf{CM}^{(\phi)} \mathbf{E}$$

$$(47)$$

$$KE = \int_{\Omega^{+}} \frac{1}{2} \rho \mathbf{u} \cdot \mathbf{u} \, dV_{x}$$

$$= \int_{\Omega_{0}} \frac{1}{2} \rho^{+} \mathbf{u}^{+} \cdot \mathbf{u}^{+} J^{+} \, dV_{y}$$

$$= \int_{\Omega_{0}} \frac{1}{2} \rho_{0}^{+} \mathbf{u}^{+} \cdot \mathbf{u}^{+} \, dV_{y}$$

$$= \int_{\Omega_{0}} \frac{1}{2} \rho_{0}^{+} \left( \sum_{i}^{N_{w}} \hat{\mathbf{u}}_{i} w_{i}^{+} \right) \cdot \left( \sum_{j}^{N_{w}} \hat{\mathbf{u}}_{j} w_{j}^{+} \right) \, dV_{y}$$

$$= \sum_{i}^{N_{w}} \sum_{j}^{N_{w}} \frac{1}{2} \hat{\mathbf{u}}_{i} \cdot \int_{\Omega_{0}} \rho_{0}^{+} w_{i}^{+} w_{j}^{+} \, dV_{y} \hat{\mathbf{u}}_{j}$$

$$= \sum_{i}^{N_{w}} \sum_{j}^{N_{w}} \frac{1}{2} \hat{\mathbf{u}}_{i} \cdot m_{ij}^{(w)} \hat{\mathbf{u}}_{j}$$

$$= \frac{1}{2} \mathbf{U} \cdot \mathbf{M}^{(w)} \mathbf{U}. \tag{48}$$

$$P_{\mathbf{n}} = \int_{\Omega^{+}} \rho \mathbf{u} \cdot \mathbf{n} \, dV_{x}$$

$$= \int_{\Omega_{0}} \rho^{+} \mathbf{u}^{+} \cdot \mathbf{n} J^{+} \, dV_{y}$$

$$= \int_{\Omega_{0}} \rho_{0}^{+} \mathbf{u}^{+} \cdot \mathbf{n} \, dV_{y}$$

$$= \int_{\Omega_{0}} \rho_{0}^{+} \left( \sum_{j}^{N_{w}} \hat{\mathbf{u}}_{j} w_{j}^{+} \right) \cdot \left( \sum_{i}^{N_{w}} \hat{\mathbf{n}}_{i} w_{i}^{+} \right) \, dV_{y}$$

$$= \sum_{i}^{N_{w}} \sum_{j}^{N_{w}} \hat{\mathbf{n}}_{i} \cdot \int_{\Omega_{0}} \rho_{0}^{+} w_{i}^{+} w_{j}^{+} \, dV_{y} \hat{\mathbf{u}}_{j}$$

$$= \sum_{i}^{N_{w}} \sum_{j}^{N_{w}} \hat{\mathbf{n}}_{i} \cdot m_{ij}^{(w)} \hat{\mathbf{u}}_{j}$$

$$= \mathbf{N} \cdot \mathbf{M}^{(w)} \mathbf{U}. \tag{49}$$

The total energy is conserved, as shown below

$$\frac{d}{dt}(IE + KE) = \mathbf{C}\mathbf{M}^{(\phi)}\frac{d\mathbf{E}}{dt} + \mathbf{U} \cdot \mathbf{M}^{(w)}\frac{d\mathbf{U}}{dt}$$

$$= \mathbf{C}\mathbf{F}^{T} \cdot \mathbf{U} - \mathbf{U} \cdot \mathbf{F}\mathbf{C}$$

$$= 0.$$
(50)

The momentum along a constant direction is conserved, as shown below

$$\frac{dP_{\mathbf{n}}}{dt} = \mathbf{N} \cdot \mathbf{M}^{(w)} \frac{d\mathbf{U}}{dt} 
= -\mathbf{N} \cdot \mathbf{FC} 
= -\sum_{i}^{N_{w}} \sum_{j}^{N_{\phi}} \hat{\mathbf{n}}_{i} \cdot \mathbf{f}_{ij} \hat{c}_{j} 
= -\sum_{i}^{N_{w}} \sum_{j}^{N_{\phi}} \hat{\mathbf{n}}_{i} \cdot \int_{\Omega^{+}} \boldsymbol{\sigma} \cdot \nabla w_{i} \phi_{j} \, dV_{x} \hat{c}_{j} 
= -\int_{\Omega^{+}} \boldsymbol{\sigma} : \nabla \mathbf{n} \, dV_{x} 
= 0.$$
(51)

### 6 The reference element

We introduce the reference element as the unit square in 2D or the unit cube in 3D. The domain of this reference element is labelled as  $\Omega_z$  and it doesn't change with time. We introduce the function

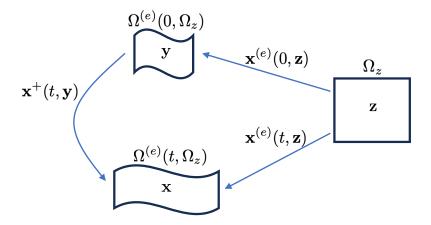

Figure 1: Schematic of the three domains  $\Omega_z$ ,  $\Omega^{(e)}(t,\Omega_z)$ ,  $\Omega^{(e)}(0,\Omega_z)$ .

 $\mathbf{x}^{(e)} = \mathbf{x}^{(e)}(t, \mathbf{z})$ , which maps from points  $\mathbf{z}$  in  $\Omega_z$  to points in the finite element e of the mesh. The evolving domain of the finite element e is giving by the function  $\Omega^{(e)} = \Omega^{(e)}(t, \Omega_z)$ . A depiction of these domains and their mappings is shown in fig. 1. Whereas for  $\Omega^+$  we had  $\Omega^+(0, \Omega_0) = \Omega_0$ , for  $\Omega^{(e)}$  the analogue does not hold, that is,  $\Omega^{(e)}(0, \Omega_z) \neq \Omega_z$ .

The mapping functions  $\mathbf{x}^{(e)}$  and  $\mathbf{x}^{+}$  are related to each other as follows

$$\mathbf{x}^{(e)}(t, \mathbf{z}) = \mathbf{x}^{+}(t, \mathbf{x}^{(e)}(0, \mathbf{z})). \tag{52}$$

We now introduce reference-element functions for density  $\rho^{(e)} = \rho^{(e)}(t, \mathbf{z})$ , velocity  $\mathbf{u}^{(e)}(t, \mathbf{z})$ , and internal energy  $e^{(e)}(t, \mathbf{z})$ . These satisfy the following expressions

$$\rho^{(e)}(t, \mathbf{z}) = \rho^{+}(t, \mathbf{x}^{(e)}(0, \mathbf{z})),$$

$$\mathbf{u}^{(e)}(t, \mathbf{z}) = \mathbf{u}^{+}(t, \mathbf{x}^{(e)}(0, \mathbf{z})),$$

$$e^{(e)}(t, \mathbf{z}) = e^{+}(t, \mathbf{x}^{(e)}(0, \mathbf{z})).$$
(53)

We finally define the Jacobian  $\mathbf{J}^{(e)} = \mathbf{J}^{(e)}(t, \mathbf{z})$  as  $\mathbf{J}^{(e)} = \partial \mathbf{x}^{(e)}/\partial \mathbf{z}$ , and label its determinant as  $J^{(e)} = J^{(e)}(t, \mathbf{z})$ . Using eq. (52) in the definition of  $\mathbf{J}^{(e)}$  we get

$$\mathbf{J}^{(e)} = \left(\frac{\partial \mathbf{x}^{+}}{\partial \mathbf{y}}\right)_{\mathbf{y} = \mathbf{x}^{(e)}(0, \mathbf{z})} \frac{\partial \mathbf{x}^{(e)}(0, \mathbf{z})}{\partial \mathbf{z}}$$
$$= \left(\mathbf{J}^{+}\right)_{\mathbf{y} = \mathbf{x}^{(e)}(0, \mathbf{z})} \mathbf{J}_{0}^{(e)}, \tag{54}$$

where  $\mathbf{J}_0^{(e)} = \mathbf{J}^{(e)}(0, \mathbf{z})$ . Taking the determinant of the above gives

$$J^{(e)} = (J^{+})_{\mathbf{y} = \mathbf{x}^{(e)}(0, \mathbf{z})} J_0^{(e)}, \tag{55}$$

where  $J_0^{(e)} = J^{(e)}(0, \mathbf{z}).$ 

We now show the following

$$\int_{\Omega_z} \rho^{(e)} J^{(e)} dV_z = \int_{\Omega_z} \rho^+(t, \mathbf{x}^{(e)}(0, \mathbf{z})) J^{(e)} dV_z$$

$$= \int_{\Omega_z} \rho(t, \mathbf{x}^+(t, \mathbf{x}^{(e)}(0, \mathbf{z}))) J^{(e)} dV_z$$

$$= \int_{\Omega_z} \rho(t, \mathbf{x}^{(e)}(t, \mathbf{z})) J^{(e)} dV_z$$

$$= \int_{\Omega^{(e)}} \rho dV_x. \tag{56}$$

Additionally, we can evaluate eq. (25) at  $\mathbf{y} = \mathbf{x}^{(e)}(0, \mathbf{z})$  to obtain

$$\rho^{(e)} = \frac{\rho_0^{(e)} J_0^{(e)}}{J^{(e)}}. (57)$$
