Chapter 1

Lagrangian and Eulerian PDFs

1.1 Eulerian PDF

Consider an Eulerian velocity field $\mathbf{u} = \mathbf{u}(\mathbf{x}, t)$. The Eulerian PDF $f = f(\mathbf{V}; \mathbf{x}, t)$ gives the probability that the velocity field will have a value of $\mathbf{V}$ at location $\mathbf{x}$ and at time t. We'll also introduce the fine-grained Eulerian PDF $f' = f'(\mathbf{V}; \mathbf{x}, t)$, which is defined as

$$f'(\mathbf{V}; \mathbf{x}, t) = \delta(\mathbf{u}(\mathbf{x}, t) - \mathbf{V}). \tag{1.1}$$

Note: a delta function of a 3D argument means the following $\delta(\mathbf{a}) = \delta(a_1)\delta(a_2)\delta(a_3)$. The Eulerian PDF can be obtained from the fine-grained Eulerian PDF using

$$f(\mathbf{V}; \mathbf{x}, t) = \langle f'(\mathbf{V}; \mathbf{x}, t) \rangle. \tag{1.2}$$

The proof is as follows,

$$\begin{aligned}
\langle f'(\mathbf{V}; \mathbf{x}, t) \rangle &= \langle \delta(\mathbf{u}(\mathbf{x}, t) - \mathbf{V}) \rangle \\
&= \int \delta(\mathbf{V}' - \mathbf{V}) f(\mathbf{V}'; \mathbf{x}, t) d\mathbf{V}' \\
&= f(\mathbf{V}; \mathbf{x}, t).
\end{aligned} \tag{1.3}$$

1.2 Lagrangian PDF

Consider a Lagrangian particle with velocity $\mathbf{u}^+ = \mathbf{u}^+(t, \mathbf{y})$ and position $\mathbf{x}^+(t, \mathbf{y})$. The Lagrangian PDF $f_L = f_L(\mathbf{V}, \mathbf{x}; t|\mathbf{y})$ gives the probability that the particle that started at location $\mathbf{y}$ at the reference time t_0 will have a velocity $\mathbf{V}$ and position $\mathbf{x}$ at time t. We'll also introduce the fine-grained Eulerian PDF $f_L' = f_L'(\mathbf{V}, \mathbf{x}; t|\mathbf{y})$, which is defined as

$$f_L'(\mathbf{V}, \mathbf{x}; t|\mathbf{y}) = \delta(\mathbf{u}^+(t, \mathbf{y}) - \mathbf{V})\delta(\mathbf{x}^+(t, \mathbf{y}) - \mathbf{x}). \tag{1.4}$$

Note: a delta function of a 3D argument means the following $\delta(\mathbf{a}) = \delta(a_1)\delta(a_2)\delta(a_3)$. The Lagrangian PDF can be obtained from the fine-grained Lagrangian PDF using

$$f_L(\mathbf{V}, \mathbf{x}; t|\mathbf{y}) = \langle f_L'(\mathbf{V}, \mathbf{x}; t|\mathbf{y}) \rangle. \tag{1.5}$$

The proof is as follows,

$$\begin{aligned}
\langle f_L'(\mathbf{V}, \mathbf{x}; t|\mathbf{y}) \rangle &= \langle \delta(\mathbf{u}^+(t, \mathbf{y}) - \mathbf{V})\delta(\mathbf{x}^+(t, \mathbf{y}) - \mathbf{x}) \rangle \\
&= \int \delta(\mathbf{V}' - \mathbf{V})\delta(\mathbf{x}' - \mathbf{x}) f(\mathbf{V}', \mathbf{x}'; t|\mathbf{y}) d\mathbf{V}' d\mathbf{x}' \\
&= f_L(\mathbf{V}, \mathbf{x}; t|\mathbf{y}).
\end{aligned} \tag{1.6}$$

1.3 Relation between Lagrangian and Eulerian PDFs

As a quick side note, we mention that the inverse of $\mathbf{x}^+$ is $\mathbf{y}^+ = \mathbf{y}^+(t, \mathbf{z})$, which gives the initial location of a fluid particle that at time t is located at position $\mathbf{z}$. Thus, $\mathbf{x}^+(t, \mathbf{y}^+(t, \mathbf{z})) = \mathbf{z}$.

We begin as follows

$$
\int f_L'(\mathbf{V}, \mathbf{x}; t|\mathbf{y}) \, d\mathbf{y} = \int \delta(\mathbf{u}^+(t, \mathbf{y}) - \mathbf{V})\delta(\mathbf{x}^+(t, \mathbf{y}) - \mathbf{x}) \, d\mathbf{y}
$$

$$
= \int \delta(\mathbf{u}(\mathbf{x}^+(t, \mathbf{y}), t) - \mathbf{V})\delta(\mathbf{x}^+(t, \mathbf{y}) - \mathbf{x}) \, d\mathbf{y}
$$

$$
= \int \delta(\mathbf{u}(\mathbf{x}^+(t, \mathbf{y}), t) - \mathbf{V})\delta(\mathbf{x}^+(t, \mathbf{y}) - \mathbf{x})|\det D\mathbf{x}^+| \, d\mathbf{y}, \qquad (1.7)
$$

where we have introduced $|\det D\mathbf{x}^+|$, which is the absolute value of the determinant of the Jacobean $\partial \mathbf{x}^+/\partial \mathbf{y}$, and is equal to one for incompressible flows. Using integration by substitution we obtain

$$
\int f_L'(\mathbf{V}, \mathbf{x}; t|\mathbf{y}) \, d\mathbf{y} = \int \delta(\mathbf{u}(\mathbf{z}, t) - \mathbf{V})\delta(\mathbf{z} - \mathbf{x}) \, d\mathbf{z} = \delta(\mathbf{u}(\mathbf{x}, t) - \mathbf{V}) \qquad (1.8)
$$

Given the definition of $f'(\mathbf{V}; \mathbf{x}, t)$, we have

$$
\int f_L'(\mathbf{V}, \mathbf{x}; t|\mathbf{y}) \, d\mathbf{y} = f'(\mathbf{V}; \mathbf{x}, t). \qquad (1.9)
$$

Taking the expectation of the above we obtain

$$
\int f_L(\mathbf{V}, \mathbf{x}; t|\mathbf{y}) \, d\mathbf{y} = f(\mathbf{V}; \mathbf{x}, t). \qquad (1.10)
$$

A summary of all of the relations derived thus far is given by the following graph

Eulerian fine-grained PDF $\xleftarrow{\text{eq. (1.9)}}$ Lagrangian fine-grained PDF

$\downarrow$ eq. (1.2) $\qquad\qquad\qquad\qquad\qquad$ $\downarrow$ eq. (1.5)

Eulerian PDF $\xleftarrow{\text{eq. (1.10)}}$ Lagrangian PDF
